

TERRA FIRMA

Across the UK, property, infrastructure and land are at risk from complex ground hazards such as mining, clay subsidence, coastal erosion and landslides, all of which can have significant and costly consequences. Every day, decisions worth millions of pounds are being made without knowledge of the potential risks posed by these hazards, putting the investments of individuals, families and businesses at risk.

At Terrafirma, we are passionate about improving the understanding of the ground, and the complex ways it interacts with the built environment. Our geologists, soil scientists and mining engineers clearly communicate complex ground risks through our pioneering reports, expert advice and innovative ground risk models.

Our reports provide property-specific, ground risk assessments from all mining and natural ground stability hazards that may be required to be assessed when conducting property searches.
